The heatmap displays the presence or absence of various VF genes across different isolates, categorized by timepoint. The color scale indicates gene presence (blue) and absence (light grey). The isolates are grouped into two main clusters, each with a dendrogram at the top. The timepoints are listed on the right side of the heatmap, with a color-coded legend for each. The genes are listed on the left side of the heatmap, with a color-coded legend for each. The heatmap shows that many genes are present across all timepoints, while others are only present at specific timepoints or in specific isolates.
